SUMMARY

Frontend-focused full-stack developer (React, TypeScript, Node.js, Python) with about one year of hands-on product work (independent since October 2025, team lead on a startup since August 2026). I build with AI in two ways: AI features inside products (vision-based catalog ingestion, RAG, LLM chat bots) and an AI-native engineering process. I run Claude Code as a supervisor session that plans phases, delegates them to worker sessions and verifies every PR in a clean clone (typecheck, lint, tests, e2e) before merge.

EXPERIENCE

Learning Center — school-automation CRM startup

Frontend Team Lead · Aug 2026 – present

- Migrated the whole frontend from JSX to strict TypeScript, so type errors are caught at build time (75 commits).
- Reviewed the backend code and reported several bugs the team had missed; the backend developers fixed them.
- Wrote shared engineering rules and AI-agent instructions (`CLAUDE.md`, `docs/`) so that both people and coding agents follow one style.
- Built two-step login, developer and super-admin panels, phone-number duplicate checks and teacher KPI screens.

Independent developer / freelancer

Oct 2025 – present

- **Atoyo e-commerce** for a plumbing store in Kokand: website, Android app, desktop app, in-store TV screen and Telegram bot on one Firestore database. Used in the store until October 2026 (~500 products). Paused on 2026-10-26 because the store staff had no time to manage it and could not pay for hosting. Repo is private and available on request.
- **AI catalog ingestion:** the admin uploads a photo and Gemini Vision returns a ready product card (name, code, category, price, description). Duplicate photos are skipped using a perceptual hash (pHash).
- **AI-native delivery (Oct 2026):** coordinated parallel Claude Code sessions across about 10 repositories (supervisor plus Sonnet/Opus workers). Each phase ends with a written report, verified tests and an honest "not tested yet" list.
- Since July 2026: bringing projects to production level (deploy, tests, CI, security rules). Since October 2026: client work (Telegram bots, store sites, landing pages).

AI PROJECTS

- **telegram-bots:** 15 bots in one monorepo with a custom CLI, tests and a secret scanner before every commit. Includes a RAG bot (LangChain, ChromaDB) and Gemini-based assistants. Public bots: @KillSpam_007_Bot and @COUNTLIST_BOT (expense tracking from voice messages).
- **Instagram AI auto-reply (design stage, private):** multi-tenant DM assistant on the official Meta API. Threat model against prompt injection: no tool access for the model, user text kept separate from instructions, untrusted FAQ/RAG content, least-privilege context and output validation. At least 20 attack test cases are planned for the AI phase.
- **AI security learning:** OWASP Top 10 for LLM Applications, prompt-injection testing.

OTHER PROJECTS

- **Suhbat:** messenger with chats, groups, channels and 1:1 calls. Built with NestJS, Prisma, PostgreSQL, Socket.IO and WebRTC with its own TURN server. Web, desktop (Electron) and Android clients. Beta, v0.6.0.
- **KidsWear:** web and Android store in a Turborepo monorepo (React 19, MUI, React Native). Admin catalog management and a profit report, with Firestore rules covered by tests.
- **Organick:** React 19, Redux Toolkit, Tailwind v4, three languages, Playwright e2e tests and CI deploy.

SKILLS

Frontend: React 19, Next.js 16, TypeScript (strict), Tailwind CSS v4, MUI, Redux Toolkit, TanStack Query, Zustand
Mobile / desktop: React Native (bare CLI), Electron
Backend: Node.js, NestJS, Python (FastAPI, aiogram), REST, WebSocket, PostgreSQL, Prisma, Firestore
AI: Gemini API, Claude Code (multi-agent workflow), LangChain, ChromaDB, RAG, prompt-injection defense
Tooling: Git, GitHub Actions, Docker, Vite, Vitest, Playwright, Firebase, Railway, Linux

EDUCATION

Proteach IT training center, Kokand · Sep 2024 – Aug 2025 · programming track
Secondary school · graduated May 2026

LANGUAGES

Uzbek (native) · English (reads technical documentation) · Russian (basic)
